FIELD WATER TREATMENT GUIDE

Chapter 1. Boiling

Boiling is the most reliable disinfection method in the field.

Bring water to a rolling boil for one minute; at altitude above 2000 metres boil for three minutes. Let the water cool before drinking.

Chapter 2. Chemical disinfection

Household bleach (5-6 percent sodium hypochlorite) can be used when boiling is impossible. Add two drops per litre of clear water and wait thirty minutes. Double the dose for cloudy water. A faint chlorine smell confirms treatment.
